

Insulated dry-lining board

1. Plaster
2. Wall leaf
3. Plaster
4. Isolmant Fascia Tagliamuro IsolGypsum
5. Insulated dry-lining board IsolGypsum (PE or Fibra)

Description

IsolGypsum PE and IsolGypsum Fibra are pre-insulated dry-lining plasterboards ideal for both new build and refurbishment. The ability of pre-isolated plasterboards to be directly attached to masonry using dots and dabs of adhesive gives a considerable speed advantage over the wet plastering. IsolGypsum PE linings allow people to reach satisfaction with the thermal environment: ensuring higher wall superficial temperatures, a more comfortable operative temperature can be reached with the combining the effects of air and mean radiant temperatures. Consequently, energy consumption is reduced. The thicker the board, the better the thermal insulation will be, however in most situations the thickness of 32 is enough to ensure thermal insulation without take up too much space.
